FRECLEAN

INVESTOR BOOK

Professional Cleaning Services, Cleaning Products, and Digital Payments
Léogâne, Ouest, Haiti

Prepared for prospective investors and strategic partners

Confidential — Not an offer to sell or a solicitation of an offer to buy any security

Founder: Johnny Dubic · Founded April 16, 2025

Note on Structure and Data Standards

This Investor Book consolidates the topic areas of a standard institutional due-diligence outline into twenty-five substantive sections plus appendices, rather than fifty short stand-alone sections, so that related material (for example, competitive landscape, positioning, and moat analysis) is read together rather than fragmented. Every requested topic area is covered; none has been dropped.

Throughout this document, every factual claim is labeled by evidentiary status, using the following categories:

Label	Meaning
Verified Fact	Independently confirmed from a primary or authoritative source
Publicly Reported Information	Reported by a credible source but not independently re-verified by this analysis
Management Assumption	An input or estimate provided by FreClean's founder/management, not yet independently verified
Industry Benchmark	A figure drawn from general industry literature, which may not be Haiti-specific
Analyst Estimate	A figure derived by this analysis from other inputs, not directly sourced
Future Projection	A forward-looking, illustrative figure — never a guarantee

Where reliable data could not be found, this document says so explicitly: “Data not publicly verified.” No revenue, profit, customer count, valuation, or market-share figure for FreClean's actual historical performance is presented anywhere in this book, because none has been made available for this analysis. Every financial figure beyond this point is either a named industry benchmark or an explicitly labeled illustrative scenario.

1. Investment Thesis

FreClean is an early-stage, founder-led cleaning-services and cleaning-products company based in Léogâne, Ouest, Haiti, founded April 16, 2025. The investment thesis rests on four propositions, each of which an investor should test independently rather than accept at face value:

1. Cleaning services are a recurring, non-discretionary local demand category in a market (Haiti) with limited formal, professionally managed competition and a large informal/unregistered alternative that a disciplined operator can differentiate against on reliability and consistency.
2. A services business with genuine recurring contracts (offices, property managers, Airbnb hosts) can generate more durable, forecastable cash flow than one-off residential jobs alone, and FreClean's model is structured around building that recurring base rather than remaining transaction-by-transaction.
3. Haiti's low banking penetration and high remittance dependence (see Section 6) create a genuine, if unproven, opening for a Web3-based payment rail as a complement to cash and card — FreClean's relationship with CeloHT (Section 14) is the vehicle for testing that opening, not yet evidence that it works at scale.
4. The business is structured to be provable in stages: a single-city operating model that must demonstrate real unit economics before any claim to regional or Caribbean scalability is made (Section 16).

The current evidence for each proposition is asymmetric. Proposition 1 (market need) is well supported by macroeconomic context (Section 6). Propositions 2 through 4 are structurally plausible but not yet demonstrated with FreClean's own operating data, because FreClean is approximately one year old and has not disclosed operating figures for this analysis. An investor's central question should not be “is this a good idea” — it is “what has actually been proven so far, and what capital is needed to prove the rest.” Section 23 (Investment Readiness) and Appendix B (Missing Information) are written specifically to answer that question directly.

> *This document does not propose a valuation. Section 17 explains what would need to be true for FreClean to credibly support one, and what evidence an investor should require before anchoring on any number.*

2. Company Overview

Field	Value	Status
Company name	FreClean	Management-provided
Business type	Cleaning services and cleaning products	Management-provided
Founder	Johnny Dubic	Management-provided
Founded	April 16, 2025	Management-provided
Country	Haiti	Management-provided
Operating base	Léogâne, Ouest	Management-provided
Website	freclean.com	Management-provided; independent public presence not located — see Section 15
Business registration / Tax ID	Not provided	Data not publicly verified

FreClean operates across four connected lines: professional cleaning services, cleaning and fragrance products, an entrepreneurship/distribution program, and a Web3 payment option built on the Celo network via a partner, CeloHT. As of this analysis, cleaning services are the active line; products, the entrepreneurship program, and Web3 payments are each at earlier stages of development — see Sections 9, 10, and 14.

No independent public record of FreClean — press coverage, social media following, business registry listing, or third-party review presence — was located during this research. This is consistent with a company in its first year of operation and is not, by itself, a negative signal; it does mean an investor should treat every company-specific claim in this book as management-provided until independently confirmed, and should ask FreClean directly for registration documents, bank statements, and any existing customer records as a first step in diligence (see Section 21).

3. Founder & Management

FreClean was founded by Johnny Dubic on April 16, 2025. Beyond the founding date and role, this analysis was not provided with, and did not independently locate, verifiable biographical or professional-history information about the founder (prior operating experience, education, or prior ventures). This is a material gap for institutional diligence: professional investors weight founder track record heavily in an early-stage services business, where execution discipline is the primary value driver.

FreClean's stated governance model (detailed in Section 20) calls for a five-member management group operating on a renewable five-year term, with member identities kept private by company policy. A private management-group roster is unusual for a company approaching institutional capital; investors should expect that at least the relevant subset of management — whoever holds financial and operational authority — will need to be disclosed under a non-disclosure agreement during diligence, even if not made public.

- What is confirmed: founder identity and founding date (management-provided).
- What is not yet provided: founder's operating track record, other management-group members' identities and qualifications, any advisory board or board of directors.
- What an investor should request: founder CV/background, references from any prior business activity, and a diligence-stage disclosure of the management group referenced in FreClean's governance documentation.

4. Vision & Mission

FreClean's stated mission is to operate a professional, checklist-driven cleaning services business in Haiti that also gives customers and small entrepreneurs a path into digital commerce — specifically Celo-based stablecoin payments — without requiring them to be pre-existing crypto users. The long-run vision, per FreClean's own internal documentation, is to prove that model in Léogâne first, then expand within Haiti and potentially the wider Caribbean.

Stated plainly, for an investor: the vision is not to build a cryptocurrency project that happens to clean houses. It is to build a cleaning company that can demonstrate a working, disciplined, low-friction Web3 payment option as one differentiator among several — brand consistency, checklist quality control, and recurring-contract focus being the others. Section 15 (Competitive Positioning) evaluates how defensible that differentiation actually is today versus how defensible it could become.

5. The Problem

Three distinct problems sit behind FreClean's offering, each with a different evidentiary basis:

5.1 Fragmented, inconsistent cleaning supply

In markets without a dominant professionally managed cleaning operator, residential and small-commercial customers typically rely on informal, individually contracted labor: inconsistent quality, no standard checklist, no insurance, no dispute-resolution process, and no recurring-billing infrastructure. This pattern is well documented in comparable Caribbean and Latin American markets generally (Industry Benchmark; not Haiti-specific data) and is consistent with the absence of a large, dominant, branded cleaning company found during this research for either Haiti or the Dominican Republic (see Section 15).

5.2 A specific, under-served short-term-rental turnover need

Short-term rental hosts (Airbnb and similar) have a narrow, time-boxed cleaning requirement between guest checkout and the next check-in, which specialist marketplaces such as Turno (formerly TurnoverBnB) exist specifically to solve in larger markets (Verified — Turno's own public materials describe exactly this model). Whether an equivalent, sufficiently large short-term-rental base exists in Léogâne specifically to support this as a standalone growth channel is not independently confirmed — see Section 6.

5.3 Limited access to convenient digital payment options

A majority of Haiti's population is unbanked or under-banked (Publicly Reported — World Bank Global Findex and related financial-inclusion literature), and mobile-money and digital-finance adoption is an active national policy focus rather than an already-solved problem. This creates a real, if still-forming, opening for a low-friction digital payment rail alongside cash — the problem FreClean's Web3 payment option (Section 14) is aimed at, distinct from the cleaning-services problem itself.

> *Investors should note that Problems 5.1 and 5.3 are structurally different businesses (cleaning operations vs. payments infrastructure) bundled under one brand. This is a reasonable strategic bet — payments can be a genuine differentiator — but it is also a reason the business plan should be evaluated as a cleaning company with a payment feature, not a payments company with a cleaning use case.*

6. Market Opportunity

6.1 Macroeconomic context

Indicator	Approximate figure	Status
GDP per capita	Roughly US$1,700–1,900 (recent-year estimates)	Publicly Reported — World Bank Haiti country data
Remittances as share of GDP	A very large share, widely cited in the low-to-mid twenty percent range in recent years	Publicly Reported — World Bank / IMF Haiti data
Banking penetration	A majority of adults unbanked or under-banked	Publicly Reported — World Bank Global Findex and related financial-inclusion sources
Léogâne population	On the order of the low hundreds of thousands across the commune and arrondissement	Publicly Reported — Haiti national statistics as reported via secondary demographic sources

Two features of this context matter directly to FreClean's model. First, Haiti's GDP per capita is among the lowest in the Western Hemisphere, which means FreClean's own pricing (Section 32 / financial model) must be calibrated to local purchasing power, not to U.S. or Dominican Republic price points — the financial model in this book is built on illustrative, Haiti-context pricing for exactly this reason. Second, the combination of high remittance dependence and low banking penetration is the specific macro condition that makes a mobile-first digital payment rail (Section 14) a plausible — not proven — value-add, since remittance recipients are already accustomed to receiving money through non-traditional-bank channels.

6.2 Total addressable market: what is and isn't known

No authoritative, published market-size figure for Haiti's residential or commercial cleaning-services sector was located during this research, and none is presented here as if it existed. Constructing a bottom-up estimate (households in Léogâne and the wider Ouest department, multiplied by an assumed cleaning-service adoption rate and an assumed price point) would produce a number, but that number would be an Analyst Estimate built on several unverified assumptions stacked together — the kind of figure this book is specifically designed not to present as fact. The honest position is: a market clearly exists (people and businesses need cleaning done), but its addressable size in dollar terms is not independently known, and FreClean's own booking and revenue data, once available, is a better foundation for market sizing than a top-down estimate would be.

6.3 Short-term rental / Airbnb opportunity

Whether Léogâne and the surrounding area has a short-term-rental base large enough to support a dedicated Airbnb-turnover channel at meaningful scale is not independently confirmed by this research — data not publicly verified. This is a specific, answerable diligence question (how many active short-term-rental listings exist within FreClean's service radius) that FreClean should be able to help answer using publicly available listing-platform data, and it materially affects how much weight the Airbnb revenue line in the financial model should carry.

7. Industry Structure & Customer Segments

7.1 Industry structure

The cleaning-services industry, globally and in comparable emerging markets, typically has three layers: (1) informal, individually contracted labor with no brand, no standard process, and cash-only payment; (2) small local firms, often single-city, with some staff and basic processes but limited technology; and (3) larger branded or franchised operators with standardized training, quality control, and often software-driven scheduling and billing. Research for this book found evidence of layer 2 operators in Haiti (for example, Klean-X, a Port-au-Prince/Cap-Haïtien commercial cleaning company operating since 2010 — Publicly Reported, based on the company's own public materials) but no evidence of a layer-3, multi-city, professionally standardized operator dominating the national market. The Dominican Republic's cleaning sector, included in this research at the assignment's request, appears similarly fragmented among small and mid-size operators, with no single authoritative market-structure report located — data not publicly verified beyond that general characterization.

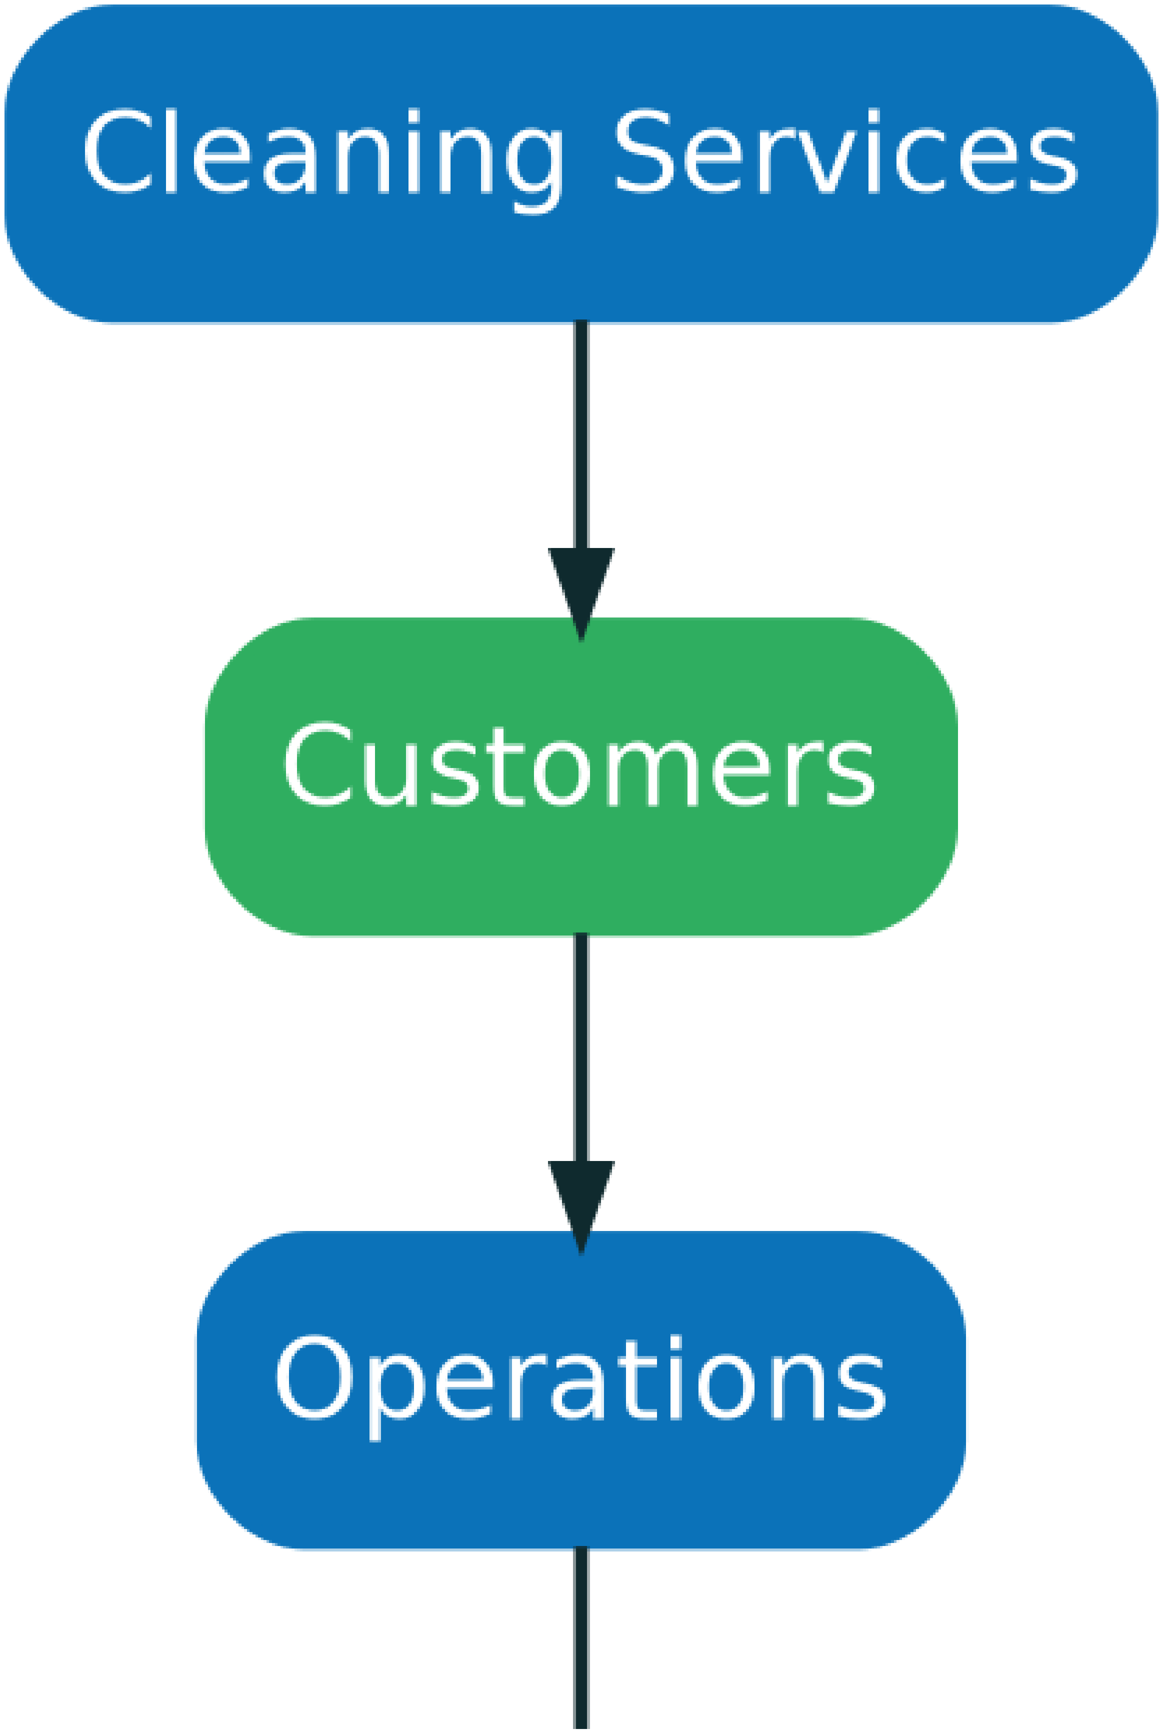
FreClean's stated positioning — checklist-driven service, consistent branding, and a technology/payment layer — targets layer 3 characteristics from a layer 2 starting point. That gap between positioning and current scale is normal for an early-stage company and is not, by itself, a flaw; it is simply the distance the business has to travel, which is what capital and time are for.

7.2 Customer segments

Segment	Core need	Revenue characteristic
Residential households	Recurring or one-time home cleaning	Transactional or light-recurring; price-sensitive
Short-term rental hosts (Airbnb)	Fast turnover between guest stays	Recurring, schedule-driven, time-critical
Offices / small businesses	Scheduled recurring cleaning	Recurring contract; most forecastable revenue
Hotels	Room turnover and common-area cleaning	Potentially large-volume recurring contract; not yet an active FreClean line (Section 9)
Post-construction / deep clean	One-time intensive clean	Project revenue; higher ticket, lower frequency
Entrepreneurs / small retailers (product line)	Wholesale product access to resell	B2B distribution revenue; program still in early development (Section 9)

Of these six segments, office contracts and (once validated) hotel contracts carry the most weight in a recurring-revenue investment thesis, because they are the segments least dependent on repeated individual customer-acquisition spend. The financial model in this book (Section 18) is deliberately structured to track office-contract revenue as a distinct “recurring revenue percentage of total” KPI for this reason.

8. The FreClean Solution



Cleaning Services
Customers
Operations

Figure 1 — FreClean Business Architecture

FreClean's answer to the problems in Section 5 is a single operating stack: standardized cleaning delivery, layered with basic operations technology (booking and staff dispatch), a formal quality-control checklist system, three payment options (cash, card, and Celo-based stablecoin via CeloHT), and a stated intention to use the resulting operating and payment data to improve retention and inform expansion decisions.

Each layer above should be read at its actual current maturity, not its intended end state:

Layer	Current status
Cleaning service delivery	Active — residential, Airbnb turnover, and office cleaning lines are operating
Checklist-based quality control	Documented internally; consistency in the field not independently verified
Booking / operations technology	Basic software scaffolding built; not yet handling production transaction volume
Payments — cash and card	Cash active; card payment processing not yet integrated with a named processor
Payments — Web3 (Celo via CeloHT)	Infrastructure built (wallet connection, payment-status tracking); no verified Celo asset enabled for live payment yet
Data-driven retention/expansion	Not yet possible — depends on accumulated real transaction history that does not yet exist

> *This table is the single most important reality check in this book. FreClean's solution is well-architected on paper; the honest gap is between architecture and demonstrated production use. Section 23 turns this table directly into a milestone list.*

9. Service & Product Portfolio

9.1 Services

Service	Status
Airbnb turnover cleaning	Active
Residential cleaning	Active
Office cleaning	Active
Hotel cleaning	In development — no hotel partnership confirmed
Kitchen deep cleaning	In development
Post-construction / specialized cleaning	Planned

9.2 Products

FreClean's product line centers on a multi-surface cleaner, currently at the formulation/development stage — no SKU, finalized packaging, published Safety Data Sheet, or verified retail price exists as of this analysis. A complementary fragrance line is planned but not started. FreClean's own internal product-management process explicitly blocks a product from being marketed as “available” until it has a real SKU and verified in-production manufacturing status, which is a disciplined practice worth noting positively — it reduces the risk of an investor later discovering an overstated product claim.

9.3 Entrepreneurship / distribution channel

FreClean has designed, but not yet launched at scale, a program under which independent entrepreneurs would buy FreClean products at wholesale pricing and resell them, extending distribution beyond FreClean's own direct sales and service footprint. As of this analysis: no entrepreneur has completed the program, starter-package pricing is not finalized, and no income or profit is promised to participants under the program's own published terms. This channel should be read as a future distribution option under development, not a current revenue source.

10. Business Model & Revenue Architecture

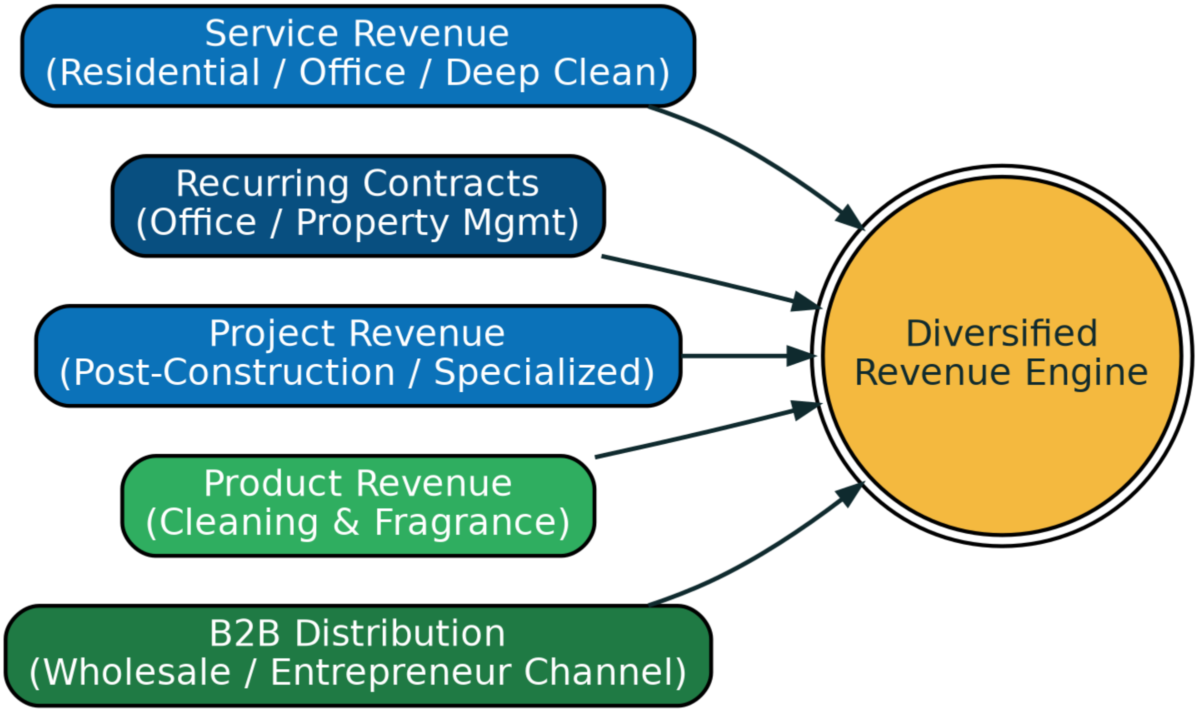


Figure 2 — Revenue Architecture

FreClean's revenue model is a services company with an attached product line and a nascent distribution channel — not a marketplace, not a subscription-software business, and not a financial-services company, despite the presence of a Web3 payment option. Five potential revenue streams feed the model: direct service revenue, recurring service contracts, project (one-time, higher-ticket) revenue, direct product sales, and B2B/entrepreneur distribution revenue. As of this analysis, direct service revenue (residential, Airbnb, office) is the only stream with active operations; the other four are at earlier stages, as detailed in Section 9.

The strategic logic for eventually diversifying across all five streams is standard for a services business: it reduces dependence on any single customer segment or seasonal pattern, and recurring contracts in particular smooth what would otherwise be lumpy, individually booked transaction revenue. This logic is sound; it is not yet evidenced by FreClean's own revenue mix, which has not been disclosed for this analysis.

11. Unit Economics

The companion financial model (freclean-financial-model.xlsx, Unit Economics tab) builds a full unit-economics dashboard — contribution margin per job by service line, Customer Acquisition Cost, Lifetime Value, LTV:CAC ratio, and CAC payback period — driven entirely by the Assumptions tab. Every input on that tab is labeled as either a named industry benchmark or a Management Assumption; none is drawn from FreClean's actual historical results, because none were made available for this analysis.

Directionally, the illustrative Base Case model produces a residential-customer LTV:CAC ratio and payback period consistent with a viable services business once assumed retention holds — but this is a property of the assumptions, not evidence about FreClean itself. The single most valuable near-term data point FreClean can produce for an investor is real CAC and real repeat/retention behavior from its first several months of actual bookings; until that exists, unit economics should be treated as a model architecture awaiting real inputs, exactly as labeled throughout the workbook.

- What is modeled: contribution margin per job, illustrative CAC, illustrative LTV, LTV:CAC, CAC payback — all clearly labeled illustrative.
- What is missing: FreClean's actual CAC by channel, actual repeat-booking rate, actual churn, actual average ticket by service line.
- What this means for diligence: request FreClean's booking and payment records (even at small volume) to replace every illustrative unit-economics input with a real one before relying on this section for a valuation view.

12. Customer Acquisition & Go-To-Market

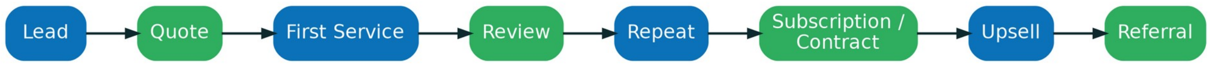

Figure 3 — Customer Journey

FreClean's go-to-market approach, per its own internal documentation, relies primarily on direct, local, word-of-mouth and in-person outreach in Léogâne, rather than paid digital advertising at this stage — a reasonable choice given the company's size and the limited efficiency of broad digital ad spend in a market with FreClean's current brand awareness. The customer journey is designed around converting a first booking into a repeat relationship and, where applicable, a recurring contract, with referral treated as the final step that feeds new demand back into the funnel.

Sales funnel, as designed

5. Lead generation — local outreach, word of mouth, and (per FreClean's website) a direct booking request form.
6. Quote — service and price communicated before commitment.
7. First service — delivered against a documented checklist (Section 13).
8. Review — customer feedback captured post-service.
9. Repeat booking or recurring contract — the point at which a customer becomes a recurring revenue source.
10. Referral — the intended (not yet measured) low-cost acquisition channel from satisfied customers.

No customer-acquisition-cost or conversion-rate data by funnel stage has been disclosed for this analysis. This is the single most important operating metric an investor should ask FreClean to begin tracking immediately, if it is not already doing so through freclean-api's customer and booking records.

13. Operating Model

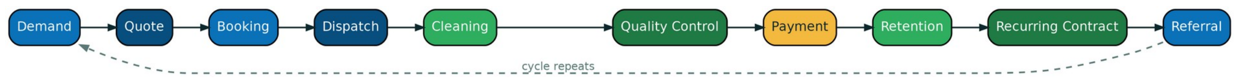

Figure 4 — Operating Flywheel

Every booking is intended to move through the same operating sequence regardless of service type: demand capture, quote, booking, team dispatch, cleaning against a written checklist, quality verification, payment, and a retention step aimed at converting the job into a repeat or recurring relationship. This is a sound operating discipline on paper — checklist-driven service delivery is precisely the mechanism that differentiates a layer-2/3 operator (Section 7) from informal competition.

13.1 Workforce model

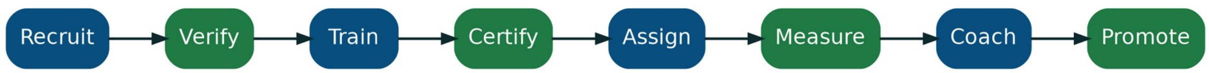

Figure 5 — Workforce Architecture

FreClean's stated workforce model — recruit, verify, train, certify, assign, measure, coach, promote — mirrors standard practice in professionally run services businesses. As of this analysis, FreClean has not disclosed current headcount, employment structure (direct employees versus contractors), wage levels, or turnover rate. These are standard diligence items (Section 21) with direct bearing on the direct-labor cost assumption used throughout the financial model.

13.2 Quality control

Quality control is designed around three mechanisms: a written, service-specific checklist for every job; an end-of-job verification step before a booking is marked complete; and monitoring of customer reviews, with any low rating intended to trigger follow-up. Whether this process is followed consistently in the field, and at what rate jobs currently require a re-clean or generate a complaint, has not been independently verified.

13.3 Technology

FreClean has built (per its own repositories) a backend API, an internal staff dashboard, and a customer-facing booking and Web3-payment interface. This is real, functioning software infrastructure appropriate to the company's stage — notably, it currently runs on development/demonstration data rather than a production database, and a public-facing booking form is not yet connected end-to-end to the backend. The technology exists; it has not yet processed production volume.

13.4 Digital payments

Covered in full in Section 14.

14. Digital Payment Strategy & the CeloHT Relationship

FreClean accepts, or intends to accept, three payment methods: cash (active), card (not yet integrated with a named processor), and a Celo-network stablecoin via a partner, CeloHT (infrastructure built; no asset yet verified and enabled for live payment). FreClean does not issue its own token and does not operate its own blockchain — a deliberate scope limitation this analysis views as a credibility positive, since it removes an entire category of regulatory and investor-skepticism risk that many "physical-world Web3" projects take on unnecessarily.

14.1 Why Web3 payments are strategically relevant here

As established in Section 6, Haiti combines high remittance dependence with low formal banking penetration — the specific macro condition under which a mobile-first digital payment rail can plausibly reduce friction relative to cash handling, without requiring users to first become conventional bank customers. This is a genuine strategic rationale, not a borrowed one; it is not, however, evidence that FreClean's specific implementation works at scale, because no verified transaction volume exists yet.

14.2 CeloHT: what is and isn't known

CeloHT is a Haiti-focused community initiative built around the Celo blockchain, with publicly stated pillars including financial education, an agent network, and an environmental (reforestation) program (Publicly Reported, based on CeloHT's own public channels and its public GitHub presence). Its scale — number of users, transaction volume, legal/corporate structure, and formal partnership terms with FreClean — is not documented in any independent, institutional source located during this research. An investor should treat "FreClean has a relationship with CeloHT" as a Publicly-Reported-adjacent, Management-provided claim requiring direct confirmation (a copy of the partnership agreement, or direct contact with CeloHT) rather than as an independently verified fact.

14.3 Current implementation status

Component	Status
Celo blockchain client (payment verification)	Built; makes real calls to a live Celo network endpoint
Supported Assets Registry	Implemented; contains zero enabled assets as of this analysis — by design, not by omission
Wallet connection (customer-facing)	Built for browser-injected wallets only; the more common Valora QR-scan flow (WalletConnect) is not yet implemented
Payment status verification	Built; enforces a forward-only status sequence with a minimum confirmation count before treating a payment as verified
Public checkout endpoint	Not yet available — the payment API currently requires staff-level authentication, blocking a live customer-facing transaction

The engineering discipline evident here — shipping an empty, honestly-labeled asset registry rather than a populated but unverified one — is a meaningful positive signal about how the team handles the gap between ambition and evidence. It does not substitute for the fact that zero verified Web3 transactions have occurred as of this analysis.

15. Competitive Landscape, Positioning & Potential Moats

15.1 Competitive landscape

Competitor type	Example / evidence	Relevance to FreClean
Informal individual labor	Widespread; not independently quantifiable	Primary substitute for residential cleaning today; low price, no consistency guarantee
Small local firms	Klean-X (Port-au-Prince / Cap-Haïtien, operating since 2010 — Publicly Reported)	Closest evidenced comparable to what FreClean aims to become; operates outside FreClean's current Léogâne base
STR-cleaning marketplaces (international model)	Turno / TurnoverBnB (Verified business model, U.S.-market-focused)	Illustrates the Airbnb-turnover segment's business logic; not confirmed to operate in Haiti
Dominican Republic cleaning operators	Fragmented small/mid-size operators; no dominant player identified	Relevant only if FreClean pursues Caribbean expansion (Section 16); not a current competitor

15.2 Competitive positioning

FreClean's claimed differentiation — checklist-driven consistency, a coherent brand, and a Web3 payment option — is a credible positioning strategy against informal competition, where none of those three elements typically exist. Against Klean-X or an equivalent small formal operator, FreClean's differentiation is less clear-cut and rests mainly on the payment option, since checklist-driven quality control is a reasonable assumption for any established formal operator, not a unique FreClean trait. This analysis found no evidence to support, and does not make, any claim that FreClean is currently superior in service quality, price, or scale to any named or unnamed competitor.

15.3 Potential moats

Potential moat	Existing advantage today	Could become a future moat if…
Brand	A completed visual identity and consistent design system exist	Sustained, consistent service quality builds real local reputation over multiple years
Recurring contracts	None disclosed as active beyond a small number of office accounts	Office/hotel contract base grows and shows low churn
Operational data	Systems built to capture it; minimal real data exists yet	A meaningful transaction history accumulates and is used to improve dispatch, pricing, and retention
Trained workforce / SOPs	Checklists documented	Field consistency is verified and staff turnover is kept low
Payment infrastructure	Built, not yet live at volume	Real, verified Web3 transaction volume accumulates and CeloHT partnership terms are confirmed and durable
Route density (geographic concentration)	Plausible given single-city operations	Booking density in Léogâne is measured and shown to reduce cost per job

None of the six potential moats above should be read as an existing competitive moat today. Each is a reasonable hypothesis for what could become defensible with time, consistent execution, and capital — which is a materially different, more honest claim than asserting FreClean already has a moat.

16. Geographic Expansion & Scaling Model

Figure 6 — Expansion Model

FreClean's own roadmap sequences growth as: prove the model in Léogâne, standardize operations and management systems, replicate within Haiti (regional expansion), and only then consider a partner or branch model for wider Caribbean expansion, explicitly including the Dominican Republic as a possible future market per this assignment's research scope. This sequencing is the correct discipline for a services business: unit economics and operational playbooks should be proven once before being multiplied, rather than scaled on assumption.

As of this analysis, FreClean is at the “pilot” stage of this model — a single city, a small number of active service lines, and no independently confirmed proof of unit economics. Any capital-deployment plan premised on near-term multi-city or multi-country expansion (Section 17) should be treated with caution until the pilot stage produces verifiable evidence, per the milestone framework in Section 23.

17. Capital Deployment Strategy

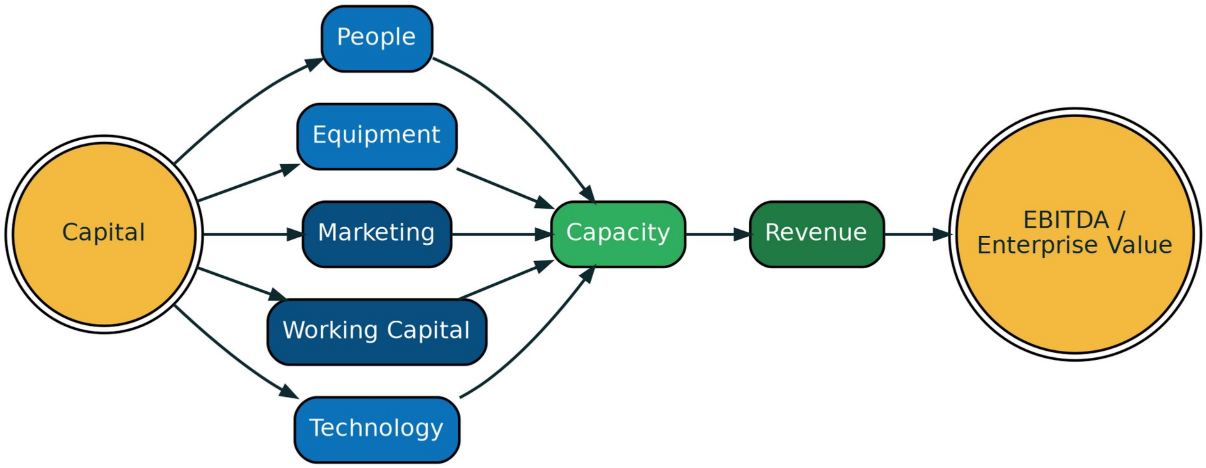

Figure 7 — Capital Deployment

This section deliberately does not propose a valuation or a specific raise amount. Both should be derived from evidence FreClean does not yet have, not asserted in advance. What this section does provide is the analytical framework an investor and FreClean should use together once real operating data exists.

17.1 What determines valuation, and what would support a higher one

- Demonstrated, verifiable unit economics (Section 11) from real bookings, not the illustrative model in this book.
- A track record of recurring-contract retention (offices, and eventually hotels), which de-risks revenue forecasting more than one-off residential volume does.
- Evidence that the Web3 payment channel actually reduces cost, friction, or expands the addressable customer base relative to cash/card alone.
- Clean corporate and financial records (Section 21) that reduce diligence risk and time.
- A management team and governance structure (Section 20) that can be diligenced, not one that remains partially anonymous.

17.2 Capital allocation discipline

The core risk to manage in either direction is straightforward: overcapitalization funds growth ahead of proven demand and operational capacity, inflating burn without a corresponding increase in defensible enterprise value; undercapitalization starves a genuinely working model of the working capital and equipment it needs to fulfill demand it has already proven it can generate. The correct sequencing is to size any raise to the specific milestones in Section 23, not to a round-number target.

17.3 Financing instruments — advantages, disadvantages, and implications

Instrument	Advantages	Disadvantages / investor expectations	Founder implications
Equity	No repayment obligation; aligns investor and founder incentives on long-term	Requires a valuation basis FreClean cannot yet defend with real data; dilutes	Loss of some control; investor governance rights typically follow

Instrument	Advantages	Disadvantages / investor expectations	Founder implications
	value	ownership	
Strategic investment (e.g. a payments or hospitality partner)	Can bring distribution, credibility, or technical resources beyond cash	Strategic investors often want commercial terms (exclusivity, pricing) that can constrain future flexibility	May shape product/partnership roadmap, not just capital
Debt	No dilution; interest is a known, fixed cost	Requires reliable cash flow to service — not yet demonstrated; Haiti-specific commercial lending terms not verified in this research	Repayment obligation regardless of business performance
Revenue-based financing	Repayment scales with actual revenue; less rigid than fixed debt	Requires verifiable revenue reporting infrastructure FreClean has not yet demonstrated at scale	Ongoing revenue-share reduces cash flow during growth phases
Grants / development finance	Non-dilutive; often aligned with financial-inclusion or SME-development mandates relevant to FreClean's Haiti/Web3-inclusion angle	Typically smaller amounts, longer application cycles, and reporting requirements	Limited strategic influence from the funder, but also limited capital scale

Given FreClean's current stage — pre-verified unit economics, single-city operations, informal governance disclosure — the most defensible near-term path is a small milestone-based instrument (equity or convertible, or development-finance/grant capital) sized to fund the specific proof points in Section 23, with a larger institutional round considered only once those milestones are met. This is elaborated in Section 23.

18. Financial Model & 36-Month Forecast

The full financial model accompanying this book (freclean-financial-model.xlsx) is a 36-month, monthly-granularity model spanning three scenarios — Conservative, Base, and Expansion — built entirely from labeled assumptions (industry benchmarks or explicit Management Assumptions), with zero inputs drawn from undisclosed FreClean historical data. Every figure in this section and in the workbook is prefixed, functionally, by the same label: Illustrative Scenario — Not Historical Company Data.

18.1 Model architecture

- Assumptions tab — every input driver (starting volumes, monthly growth, pricing, cost percentages, operating expenses, capital, unit-economics inputs, and scenario multipliers), each with a source or an explicit assumption label.
- Conservative / Base / Expansion Case tabs — 36 months of Revenue, COGS, Gross Profit, Operating Expenses, EBITDA, EBIT, and a simplified Cash Flow build, driven entirely by formulas referencing the Assumptions tab.
- Scenario Summary tab — Year 1 / Year 2 / Year 3 totals across all three scenarios, with a chart comparing illustrative EBITDA by year and scenario.
- Unit Economics tab — contribution margin, CAC, LTV, LTV:CAC, and CAC payback, computed directly from the Assumptions tab.
- Sources tab — the claim-by-claim verification table referenced throughout this book.

18.2 Illustrative outputs (Base Case)

Under the Base Case scenario's stated assumptions, the model produces early-period operating losses consistent with a small, fixed-cost-heavy service business, improving toward positive EBITDA margin as revenue scales against largely fixed overhead — the ordinary shape of a services-business ramp, not a claim about FreClean's actual trajectory. The Conservative Case, at reduced volume growth and flat pricing, produces a materially slower and shallower path to profitability; the Expansion Case, at faster growth and modest pricing power, produces a meaningfully faster one. The magnitude of the gap between these three scenarios is itself informative: it shows how sensitive outcomes are to volume-growth execution specifically, more than to any single cost assumption — which should focus diligence attention on FreClean's actual customer-acquisition and retention capability (Sections 11–12) above all else.

18.3 Break-even and cash-flow framing

The model's Free Cash Flow and Cumulative Cash Balance rows (each scenario tab) show the month in which each scenario's monthly free cash flow first turns positive, and the resulting cash trajectory against the model's illustrative starting-capital assumption. Because that starting-capital figure is itself illustrative and editable, an investor's most useful exercise with this model is not reading the default output, but substituting a real proposed investment amount and real, disclosed FreClean cost data as they become available, to see the resulting runway and break-even timing directly.

> *The workbook, not this prose summary, is the definitive financial deliverable. This section exists to explain how to read it and what it does and does not represent.*

19. Risk Analysis & Mitigation Framework

Risk	Likelihood	Impact	Mitigation / current status
Unproven unit economics at real operating volume	High (unproven, not unlikely)	High	Model architecture exists and is ready to be populated; real data collection should begin immediately regardless of financing timeline
Founder/key-person dependence; limited disclosed management bench	Medium–High	High	Five-member management group referenced in governance docs; identities and qualifications not yet disclosed for diligence
CeloHT partnership scale, terms, and durability unverified	Medium	Medium–High (for the Web3 differentiation thesis specifically)	Direct confirmation and partnership-agreement review recommended before weighting this channel in any valuation case
Haiti macro/security/political operating environment	Medium–High (elevated relative to most markets)	High	Single-city concentration limits geographic exposure but does not eliminate country-level risk; not separately insured or hedged as far as disclosed
Limited formal banking/financial infrastructure	Medium	Medium	Part of the rationale for the Web3 payment channel; also a friction on conventional debt financing (Section 17)
Regulatory treatment of stablecoin payments in Haiti	Medium (uncertain, not necessarily adverse)	Medium	No token issuance, no custody of customer funds beyond normal payment processing — a deliberately narrow, lower-risk Web3 scope
Team capacity constraints limiting service quality as volume grows	Medium	Medium	Checklist-driven process and end-of-job verification designed to standardize quality independent of which team is dispatched
Product line safety/regulatory compliance before commercial sale	Low (currently blocked by internal process)	Medium if bypassed	Internal rule blocks 'available' status without a completed Safety Data Sheet and real SKU — a genuine control, not just a stated intention
Data room / financial record-keeping immaturity	High (currently true)	Medium (mainly a diligence-speed risk, not a going-concern risk)	Addressed directly in Sections 21–22 of this book

The likelihood and impact ratings above are this analysis's qualitative judgment, not a modeled or actuarial probability, and should be revisited once FreClean discloses real operating and financial data.

20. Governance

FreClean's stated governance structure consists of the founder, Johnny Dubic, and a five-member management group operating on a renewable five-year term cycle, with member identities kept private by internal policy. Treasury and other significant decisions are stated to require more than one person's approval (a multi-signature-style control for Web3 treasury funds specifically), rather than resting with the founder alone — a positive structural intention. As of this analysis, several elements of this structure remain undocumented in a form suitable for institutional diligence: appointment, renewal, and removal procedures for management-group members; voting and quorum rules; a conflict-of-interest policy; and formal board or advisory oversight, if any exists beyond the management group itself.

- Confirmed: founder identity; a stated five-member management structure with five-year terms; a stated multi-signature intention for treasury control.
- Not yet documented: management-group appointment/removal procedures, voting rules, conflict-of-interest policy, and (per company policy) member identities.
- Diligence expectation: institutional investors will typically require at least a confidential disclosure of management-group composition and a documented decision-rights framework before a significant capital commitment, even where public disclosure remains limited.

21. Investor Reporting & Due-Diligence Requirements

21.1 Recommended investor reporting cadence (once financed)

Report	Frequency	Core contents
Operating dashboard	Monthly	Bookings by service line, revenue, jobs completed, active recurring contracts, payment method mix, cash balance
Financial summary	Monthly	Actual P&L vs. the financial model's relevant scenario, variance commentary
Investor letter	Quarterly	Narrative update: what was proven, what wasn't, what changed, upcoming milestones
Governance/compliance update	Quarterly or as-needed	Any change in management group, treasury controls, or material legal/regulatory development

21.2 Due-diligence document requirements

The following is the minimum standard due-diligence request list a serious investor should expect to issue, mapped to the data-room structure in Section 22:

- Corporate: registration documents (or confirmation of pending registration status), founder identification, any existing corporate governance documents.
- Financial: bank statements, any existing bookkeeping records, tax filings if applicable, the financial model in this book alongside any real financials once available.
- Commercial: customer list or booking records (even if small), any signed contracts (office, hotel, or product-supply agreements), pricing history.
- Operations: staffing records, checklist/SOP documentation, incident and complaint logs, insurance documentation if any exists.
- People: employment or contractor agreements, org chart, management-group disclosure (confidential if necessary).
- Technology: access to or a technical review of the FreClean-api, admin, and payment repositories; security posture documentation.
- Partnerships: the CeloHT agreement or equivalent documentation of that relationship's actual terms.
- Legal: any pending or historical disputes, IP ownership confirmation (brand, product formulations), regulatory correspondence if any.
- Financing: any prior financing (friends-and-family, grants, loans) and its terms, cap table if one exists.

22. Data-Room Structure

This Investor Book is accompanied by a structured data room (see the due-diligence/ directory in the freclean-investor-book repository), organized into nine categories matching Section 21.2. Each folder contains a README describing exactly what documentation belongs there and its current population status. As of this analysis, every folder is a structure awaiting real documents — none is populated with placeholder or illustrative content, consistent with this book's data standards.

Folder	Purpose	Status
01-corporate	Registration, incorporation, governance documents	Structure ready; awaiting documents
02-financial	Bank statements, bookkeeping, tax records, the financial model	Financial model included; historical financials awaiting disclosure
03-commercial	Customer records, contracts, pricing history	Structure ready; awaiting documents
04-operations	SOPs, checklists, incident logs, insurance	Checklists referenced from freclean-operations; incident logs awaiting real data
05-people	Employment records, org chart, management disclosure	Structure ready; awaiting documents
06-technology	Technical documentation, security posture	Referenced from existing freclean-* repositories
07-partnerships	CeloHT agreement and other partnership documentation	Structure ready; awaiting documents
08-legal	Disputes, IP, regulatory correspondence	Structure ready; awaiting documents
09-financing	Prior financing, cap table	Structure ready; awaiting documents

23. Investment Readiness & Milestone-Based Financing Strategy

Directly answering the question this book is built around — what must be proven before a large investment — the following milestones are proposed as the sequence in which FreClean should de-risk itself for larger institutional capital. Each milestone is deliberately specific and checkable, not aspirational.

Milestone	Evidence that would satisfy it
Real operating data replaces illustrative assumptions	Minimum 3–6 months of actual booking, revenue, and cost data recorded in freclean-api's production data layer (not the in-memory demo store)
Verified unit economics	Actual CAC by channel, actual repeat-booking rate, actual average ticket by service line, reconciled against bank records
At least one verified Web3 payment	A real, on-chain-confirmed Celo stablecoin transaction, with a corresponding Supported Assets Registry entry carrying a real contract address and verification date
Recurring-contract proof point	At least a handful of office (or hotel) contracts retained for 6+ months, evidencing the recurring-revenue thesis in Section 10
Governance disclosure	Confidential disclosure of the five-member management group's composition and qualifications to a prospective institutional investor
Financial record-keeping maturity	Bank statements and bookkeeping sufficient to support a real (not illustrative) financial model rebuild
Data room populated	The structure in Section 22 filled with real documents across all nine categories, not placeholders

A milestone-based financing strategy — a smaller initial tranche sized to fund the achievement of these milestones, followed by a larger round once they are met — is the structure most consistent with FreClean's current stage, and protects both FreClean (against over-dilution on an unsupportable early valuation) and the investor (against committing significant capital ahead of verifiable evidence).

24. Long-Term Strategic Vision

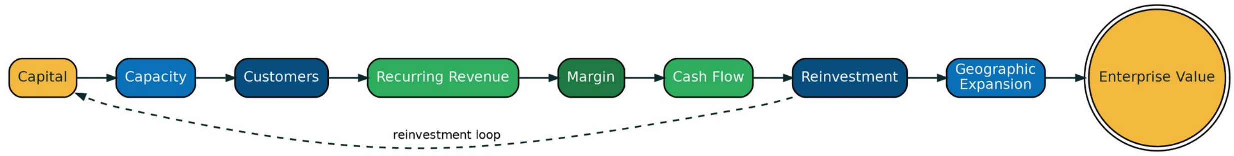

Figure 8 — Investor Value-Creation Flywheel

FreClean's opportunity, if the milestones in Section 23 are met, is to become a regionally credible, professionally standardized cleaning-services platform headquartered in Haiti, with a genuinely working digital-payment layer as a structural differentiator rather than a marketing feature — expanding first within Haiti, then potentially into comparable Caribbean markets such as the Dominican Republic, where this research found a similarly fragmented competitive landscape and no dominant incumbent. The model could become scalable if recurring-contract retention, real Web3 transaction volume, and consistent service quality are each independently demonstrated at the Léogâne pilot stage first.

This is deliberately written as a conditional statement, not a prediction. The principal long-term value-creation drivers are capital deployed into proven capacity, converted into recurring customer relationships, converted into margin and cash flow, reinvested into further geographic reach — the loop illustrated above. Every link in that loop currently exists as a design, not yet as a demonstrated result.

25. Investment Case

An investor should walk away from this book with a specific, bounded understanding of FreClean, not a general impression. To restate it plainly:

- What FreClean is: an approximately one-year-old, founder-led cleaning-services company in Léogâne, Haiti, with an attached product line, an early-stage entrepreneur distribution program, and a built-but-not-yet-live Web3 payment option via CeloHT.
- Why the opportunity could matter: a plausible, evidence-consistent macro case (low banking penetration, high remittance dependence, fragmented local competition) exists for a disciplined, checklist-driven operator with a genuine digital-payment differentiator.
- What is not yet proven: real unit economics, real recurring-contract retention, real Web3 transaction volume, and a fully disclosed governance and financial record.
- What should happen before significant capital is committed: the milestone sequence in Section 23, sized to a financing structure like the ones described in Section 17.3.

The current evidence supports treating FreClean as a credible, well-architected early-stage operator worth continued diligence — not yet as a company whose growth trajectory, unit economics, or valuation can be independently confirmed. An investor should verify every management-provided claim in this book directly with FreClean, using the due-diligence request list in Section 21.2 and the data room in Section 22, before relying on it for a financing decision.

Appendix A — Source & Verification Table

A full, expanded version of this table — with row-by-row source citations — is maintained in the accompanying financial model's Sources tab and in market-research/sources/. Summary below.

Claim area	Status
Haiti macroeconomic indicators (GDP/capita, remittances, banking penetration)	Publicly Reported — World Bank / IMF
CeloHT's existence and stated focus areas	Publicly Reported — CeloHT's own public channels
CeloHT's scale and formal partnership terms with FreClean	Data not publicly verified
FreClean's independent public presence (press, reviews, registry)	Data not publicly verified — none located
Cleaning-industry labor cost as % of revenue	Industry Benchmark — general literature, not Haiti-specific
Turno / TurnoverBnB business model	Verified — company's own public materials
Klean-X as an operating Haiti cleaning company since 2010	Publicly Reported — company's own public materials
Dominican Republic cleaning-market structure	Data not publicly verified beyond general fragmentation observation
Léogâne population and 2010 earthquake context	Publicly Reported
All FreClean financial figures in this book	Illustrative Scenario — Not Historical Company Data

Appendix B — Information FreClean Must Provide

The following information gaps, consolidated from every section of this book, represent what this analysis was unable to verify or was not provided, and what FreClean should supply to move from this book's current “credible but unproven” assessment toward investment readiness.

11. Actual historical financial records (bank statements, revenue, costs) for any period of operation to date.
12. Business registration and tax identification documentation, or a confirmed timeline for obtaining them.
13. Founder professional background and any prior venture history.
14. Full management-group composition and qualifications (may be disclosed confidentially).
15. Actual customer/booking data: volume, repeat rate, average ticket by service line, by month.
16. Actual CAC by acquisition channel.
17. Current staffing levels, employment structure, and wage data.
18. The CeloHT partnership agreement or equivalent documentation of its actual terms and CeloHT's own scale.
19. Any existing contracts (office, hotel, product-supply) and their terms.
20. Insurance coverage documentation, if any exists.
21. Any prior financing history and existing cap table, if applicable.
22. A confirmed count of short-term-rental listings within FreClean's service radius, to properly size the Airbnb revenue opportunity.

Appendix C — Investment-Readiness Assessment

Dimension	Assessment
Business model clarity	Clear and coherent on paper; four-pillar structure is legible and each pillar's current maturity is distinguishable
Market rationale	Plausible and supported by macro context; total addressable market not independently sized
Product / service maturity	Core cleaning service is active; product line and entrepreneurship program are pre-revenue
Technology maturity	Real, functioning software exists across the stack; not yet handling production transaction volume
Financial verifiability	Not yet verifiable — no historical financials disclosed; model architecture is ready to receive real data
Unit economics evidence	Illustrative only; no real CAC, retention, or churn data available
Governance transparency	Partially disclosed; management-group identities and decision rights not yet documented for diligence
Data-room readiness	Structure complete; substantive documents not yet populated
Overall readiness for institutional capital	Pre-institutional. Appropriate next step is a milestone-based, smaller financing instrument (Section 17.3, Section 23) rather than a large priced round

This assessment reflects the information available to this analysis as of the date of this book. It should be revisited as FreClean discloses additional documentation.
